8	Bangladesh	166,499,261	18	Germany	84,061,351
9	Russia	145,998,936	19	Iran	85,125,671
10	Mexico	130,354,394	20	Thailand	69,981,117

The current world is 7.9 billion as of July 2021. according to the most recent united Nations estimates elaborated by worldometer.

Year : 2021

Population : 7,874,965,825

Net change : 80,167,086

Rate (%) : 1.03

World Population Day

History of world Population day

The World Population Day was established by the United Nations in 1989, buoyed by the interest the five Billion Day celebrated in 1987. A resolution to the effect was passed, and the day was first marked on July 11, 1990. In December 1990, the United Nations General Assembly (UNGA) decided to continue observing world population day to enhance awareness about population issues, including their relations to the environment.

Theme of

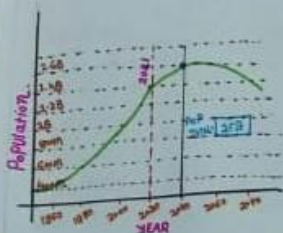

World Population day - 2021

This year, the theme of world population day 2021 is "the impact of the covid-19 pandemic on fertility". It will be observed to shed more light on the impact of the covid-19 pandemic on sexual and reproductive health and reproductive behaviour globally. It is organised by the population Division of the United Nations Department of Economics and Social Affairs (DESA)

INDIA POPULATION

India Population 2021
1,393,995,630

India's growth rate has decelerated significantly over the past few decades, attributed to growing urbanization, rising education levels, specifically among women, and increasing alleviation of poverty. While India's population growth has slowed remarkably over the last few years, it's still growing faster than China and is expected to surpass China in population by 2026, when both will have about 1.46 billion people. After 2030, India is expected to be the most populous country in the world. India is expected to reach its peak population of 1.65 billion people by 2050, after which it will begin to decline. The number of children in India peaked over a decade ago and is now decreasing.

[India Population Growth]

The 2021 Census was the second largest the world has ever seen - second only to China's Census the previous year. It took place in two phases. The first phase, in April 2020, covered all of the buildings in India, and the second phase collected data about the people of India.

The Census was a massive exercise, employing millions of Indians. The total cost of the Census came to \$40 million, which was actually considerably cheaper per person than most censuses held around the world. The average Census costs over \$4 per person, whereas the Census in India cost just \$0.50 per person. India is expected to surpass China as the world's most populous country around 2024, but like China, the growth is expected to stagnate and eventually decrease in the latter half of the 21st Century.

The 2011 Census was the Fifteenth national census carried out in India. The first was held in 1871, although it was not able to cover all of the British-ruled Indian territory.

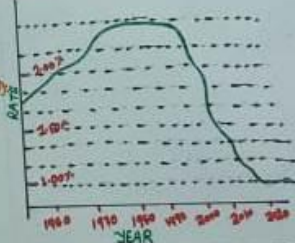

[India population projections]

India's population continues to grow fairly steadily as the years progress. Most notably, the population is growing faster than China's.

The current population of India is 1,394,105,616 based on projections of the latest United Nations data. The UN estimates the July 2, 2021 population at 1,393,409,000.

[India Growth Rate]

* Net increase of 1 person every 36662

Population estimates based on interpolation of data from world population prospects.
